

Getting Started with AERO-GUARD

This guide gets AERO-GUARD running on your Windows computer. You only do **Steps 1 and 2 once**. After that, every time you want to use AERO-GUARD you only need **Step 3**.

1 Install Python
one time

2 Run SETUP.bat
one time

3 Run START.bat
every time

1

STEP 1

Install Python

ONE TIME ONLY

AERO-GUARD needs a free program called **Python** to run.

- Go to <https://www.python.org/downloads/>
- Click the big yellow “**Download Python**” button.
- Run the installer.
- **IMPORTANT:** on the very first screen, tick the box “**Add Python to PATH**” — this step is essential.
- Click **Install Now** and wait for it to finish.

If you already have Python installed, skip this step. Not sure? It's safe to do Step 2 first — it will tell you if Python is missing.

2

STEP 2

Set up AERO-GUARD

ONE TIME ONLY

- Open the **AERO-GUARD** folder (it contains **SETUP.bat**, **START.bat** and **HOW-TO-USE.txt**).
- Double-click **SETUP.bat**.
- A black window opens and installs everything needed. This takes about **2–3 minutes** — please wait for it to finish.
- When you see “**Setup complete!**”, press any key to close the window.

■ **You only ever do this once** on this computer. You will not need SETUP.bat again unless you move to a new machine.

3

STEP 3

Open AERO-GUARD

EVERY TIME

- Double-click **START.bat**.
- A **black window** opens and your browser opens automatically at the login page. **Leave the black window open** while you work.
- Wait about **5–10 seconds** for the login page to appear.

Sign in with:

Email: `soviet@aero-guard.io`

Password: `aeroguard`

- Use the app for as long as you like.
- When you're finished, **close the black window** — this safely stops AERO-GUARD.

Demo login accounts

All demo accounts use the password **aeroguard**.

Account	Email	What you see
Provider (Admin)	soviet@aero-guard.io	Provider dashboard, audits, users. May ask for a security code (MFA).
Consultant	patrick@skylink.zw	The Smartpoint view with the AERO-GUARD Smart Button. No security code.

If something goes wrong

- If **SETUP.bat** says “**Python is not installed**” — do Step 1, then try again.
- If **START.bat** says “**Setup has not been run yet**” — do Step 2 first.
- If the browser shows “**This site can't be reached**” — the black window may not be open yet. Wait 10 seconds and click **Reload**. (See the companion guide: “*FIX – Site can't be reached*”.)
- For anything else, share the messages in the black window with your developer.

Remember: the black window is the engine. Keep it open while using AERO-GUARD, and close it when you're done.
