

## Fixing “This site can’t be reached”

If your browser shows “**This site can’t be reached — localhost refused to connect**” (error **ERR\_CONNECTION\_REFUSED**), it does **not** mean AERO-GUARD is broken. It only means the AERO-GUARD program is **not running yet**, so the browser has nothing to connect to.

**Simple way to picture it:** the browser is the TV screen, and AERO-GUARD is the set-top box. The screen is on, but the box is switched off. We just need to switch the box on. Follow the steps in order — most of the time only **Step 1** and **Step 2** are needed.

### 1

#### STEP 1

### Start AERO-GUARD

- Open the **AERO-GUARD** folder (the one with **START.bat**, **SETUP.bat** and **HOW-TO-USE.txt**).
- Double-click **START.bat**.
- A **black window** opens — this is the AERO-GUARD engine. **Leave it open**. Closing it switches AERO-GUARD off again.
- Wait about **5–10 seconds**. Your browser opens automatically at the login page.

Sign in with:

**Email:** `soviet@aero-guard.io`

**Password:** `aeroguard`

■ If the login page appears, you’re done. You can ignore the rest of this guide.

### 2

#### STEP 2

### Still see the error? Just reload

Sometimes the browser opens a moment **before** the engine has finished starting. That is completely normal.

- Make sure the **black window** from Step 1 is still open.
- Wait another **10 seconds**.
- On the error page, click the blue **Reload** button (or press **F5**).

Repeat the reload once or twice if needed. Once the engine is ready, the login page appears.

**Tip:** if you closed the black window by accident, AERO-GUARD stops. Go back to Step 1 and double-click **START.bat** again.

## 3

## STEP 3

**If it says “Setup has not been run yet”**

This means the one-time setup was never completed on this computer.

- In the AERO-GUARD folder, double-click **SETUP.bat**.
- A black window installs everything needed — about **2–3 minutes**. Please wait for it to finish.
- When you see “**Setup complete!**”, press any key to close it.
- Go back to **Step 1** and double-click **START.bat**.

## 4

## STEP 4

**If it says “Python is not installed”**

AERO-GUARD needs a free program called **Python** to run.

- Go to <https://www.python.org/downloads/>
- Click the yellow “**Download Python**” button and run the installer.
- **IMPORTANT:** on the first installer screen, tick “**Add Python to PATH**” before clicking **Install Now**.
- When it finishes, do **Step 3** (SETUP.bat), then **Step 1** (START.bat).

## 5

## STEP 5

**Check the address in the browser**

AERO-GUARD only answers at this exact address:

**`http://localhost:5050/login`**

- Make sure the address bar says **localhost:5050** — not a different number, and not **https://**.
- If it's wrong, type the address above and press **Enter** (while the black window is open).

## Quick checklist

| Question                                        | If NO, do this                  |
|-------------------------------------------------|---------------------------------|
| Is the <b>black window</b> open?                | Double-click START.bat (Step 1) |
| Did you wait 10 sec and click <b>Reload</b> ?   | Do Step 2                       |
| Does it say “ <b>Setup has not been run</b> ”?  | Run SETUP.bat (Step 3)          |
| Does it say “ <b>Python is not installed</b> ”? | Install Python (Step 4)         |
| Is the address <b>localhost:5050/login</b> ?    | Fix the address (Step 5)        |

## Still stuck?

- Take a photo or screenshot of the **black window** — it contains the messages that explain what went wrong.

- Send it to your developer. That black-window text is the single most useful thing for diagnosing the problem.

**Everyday use:** once set up, you only ever double-click **START.bat** to use AERO-GUARD, and close the **black window** when you're finished. You do **not** need to run SETUP.bat again.
